Example Problem on Epicyclic Gear Trains - Unacademy

Despite the advantages of epicyclic gear trains such as compact structure, lightweight and high power density, they may have relatively low efficiency compared to simple gear systems. The principle power losses in gear trains are caused by sliding friction between meshing gear tooth surfaces, churning of lubrication oils and friction in shaft support bearings.

Tabular Method For Epicyclic Gear Trains - YouTube

An epicyclic gear train (also known as planetary gear) consists of two gears mounted so that the center of one gear revolves around the center of the other. A carrier connects the centers of the two gears and rotates to carry one gear, called the planet gear or planet pinion, around the other, called the sun gear or sun wheel. The planet and sun gears mesh so that their pitch circles roll ...

Gear Train Problem Solved in easy way - YouTube

In an epicyclic gear train, the axes of the shafts, over which the gears are mounted, move relative to a fixed axis. A simple epicyclic gear train is shown in Fig. 14.15. L where a gear A and the arm C have a common axis at O 1 about which they can rotate. The gear B meshes with gear A and has its axis on the arm O 2, about which the gear B can rotate. If the arm is fixed, the gear train is ...

Epicyclic Train Example: We use the method introduced in Epicyclic Ratio Calculation for determining the final gear ratio of an epicyclic gear train. This method is extremely methodical, which is appropriate since use of intuition is quite futile with an epicyclic gear train such as the following example.

Problem 12.3 The gear train given is for a machine tool. Power is input to the gear box through the pulley indicated, and the output power to the machine table is through gear 13. Gears 2 and 3, 4 and 5, and 11 and 12 are compound gears that can move axially on splined shafts to mesh with various

Solutions to Chapter 12 Exercise Problems

With the rotation of each element of the gear train in hand, the overall gear ratio becomes easy. If the arm is the input and the planet is the output, the overall gear ratio is $3/1 = 3$. For a more involved epicyclic gear train example, please refer to the Epicyclic Gear Train Example section.
