Model-based calibration for torque control system of gasoline engines. Abstract: The optimized calibration technology is considered as one of the most important issues in modern engine control. In this paper, to reduce the workload of calibration and development costs, the Model-based Calibration (MBC) technology is applied to develop the torque control system of gasoline engines, which consists of the desired map calibration and tracking control.

In a gasoline engine the compression ratio (which controls the compression temperature) is limited by the air-fuel mixture entering the cylinders. The lower ignition temperature of gasoline will cause it to ignite (burn) at a compression ratio of less than 10:1. The average car has a 7:1 compression ratio.
