Passive crossovers of higher order than 12dB/octave can be made but are difficult to construct. Most are inefficient and inaccurate, regardless of the academic theory that describes them as being superior. The more complex a passive crossover, the more energy is required from the amplifier for it to function.

"I'll clarify - the title should read How To Make A (Simple) Speaker Crossover" Before designing the crossover, you need to know the crossover frequency and how steep the drop off will be. In my case I have a woofer that has an effective frequency range up to around 4000Hz. The range of the tweeter I'm using is from 2200Hz up to 20,000Hz.

The change in the crossover design that you made produced a tighter cleaner bass. My friend that was here from the audio club just sat their going wow, he thought that they could easily compete with 25 to \$30,000 speakers. After about a week the crossover designer made it over and he was also impressed.

Ryan, If you're talking about passive crossovers, then I don't think you can convert them from 3- to 2-way. Passive crossovers have fixed separate frequency bands for outputs and there's no easy way to recombine them. There are active crossovers that can switch from one mode to the other. But I've never seen a passive crossover that can do that.

How to Choose a Crossover - Crutchfield

A passive crossover splits up an audio signal after it is amplified by a single power amplifier, so that the amplified signal can be sent to two or more driver types, each of which cover different frequency ranges. These crossover are made entirely of passive components and circuitry; the term "passive" means that no additional power source is needed for the circuitry.

Given that the crossover of the SC-VI does have a lot of driver compensation, perhaps best is just to: 1) upgrade the critical components of the 4 way passive crossover. 2) bi-amp using one amp for the tweeter and

5"mid, and one amp for the 8" and 15" woofers. I would have the added control of having two amps per speaker.

Signal Path for a Passive Sound System You will also find digital crossovers featuring Bessel, Butterworth, and Linkwitz-Riley band-pass filters. Each crossover offers a high-frequency and low-frequency setting with selectable filter types. For tops, I typically set the HPF to 96 Hz on a 24 dB per octave Linkwitz-Riley filter and the LPF to off.

The other is to use complex high order passive crossovers designed with time alignment correction. This introduces other losses which are often more detrimental. Most domestic and professional passive speaker systems rarely use this correction. Active crossovers can have time alignment correction that does not contribute losses in other areas.
