In this work we introduce DMA malware, i.e., malware executed on dedicated hardware to launch stealthy attacks against the host using DMA. DMA malware goes beyond the capability to control DMA hardware. We implemented DAGGER, a keylogger

Since DMA usage is a key property of malware executed in isolated hardware (see Figure 1), we call this DMA malware. The execution environment of DMA malware is inaccessible from the host platform's CPU. Anti-virus software therefore is unable to detect and disable it. To the best of our knowl-edge no previous work has presented mechanisms to detect

The attacks launched by the malware dubbed DAGGER targeted host runtime memory using DMA provided to hardware devices.

Malware that attacks DMA and hides in peripherals

Malware writers constantly seek new methods to increase the infection lifetime of their malicious software. To that end, techniques such as code unpacking and polymorphism have become the norm for hindering automated or manual malware analysis and evading virus scanners. In this paper, we demonstrate how malware can take advantage of the ubiquitous and powerful graphics processing unit (GPU ...

This work addresses stealthy peripheral-based attacks on host computers and presents a new approach to detecting them. Peripherals can be regarded as separate systems that have a dedicated processor and dedicated runtime memory to handle their tasks. The book addresses the problem that peripherals generally communicate with the host via the hosts main memory, storing cryptographic keys ...
